Installation Guide **BRIGADE**
for Hardwiring the Dash Cam

Hardwiring the dash cam directly to the vehicle power enables parking surveillance feature of the device which is used to record any incident to the vehicle while the ignition is turned off.
WARNING: Make sure to install the product only when the engine ignition is turned off.
 1. Connect the adapter tip end to the dash cam DC-16 power port and connect the other end to the vehicle fusebox according to the instructions outlined below. (Please note that the location and appearance of the fuse box may vary depending on vehicle make and model so consult the vehicle owner's manual to locate the fuse panel). Note: Refer to the fuse box diagram usually found in the owner's manual to locate and connect to B+ (CC-GND) terminals.

Note: The connecting fuse location might differ depending on car make and model so check with vehicle owner's manual to find appropriate connections.
 2. Arrange the power cable from the location of the dash cam installation location fusing down to the left of the driver seat to the fuse panel.
Note: Arrange the wire so that cable does not interfere with the vehicle wiring.
 3. After connecting using the continuous power cable, turn the ignition on to and wait until 30 seconds to verify that the device automatically changes to parking surveillance mode.
 - www.brigade-electronics.com provides various reference materials in order to assist with interior infrared camera installation. Please visit the Product Support Area of the website.
 - Brigade Electronics is not responsible for damages to the dash unit and/or any attached accessories due to improper use. Installation of Brigade Electronics strongly recommends professional automotive installation services to avoid such damages.
